

# Xtract Universal

Cementos Argos enables SAP data self-service

## Challenge

We had difficulties taking data from our SAP ERP and BW (BO) to our new Azure cloud architecture. We depended on a single IT group and resources to be able to perform and maintain the data extracts.

The extractions were not optimal, creating delays and incremental costs during the data replication process.

“Xtract Universal has allowed us to extract data from the main company’s transactions from SAP (ERP-BW-BO), in a quick and easy way. We had the flexibility to add other teams that did not have much knowledge of SAP tools to self-manage and perform multiple extractions without relying on the IT team.”

**Natalia Quintero**, Head of Data and Information

## Solution

We have been working with **Xtract Universal** for 2 years, performing data extractions from SAP ERP, BW/BO and integrating the data with our Azure solution. This has allowed us to bring the information to a Blob storage, in an efficient and automated way. Xtract Universal allowed us to manage the extractions of our SAP source systems as an agile and accurate process. Cementos Argos has benefited from this in several ways:

- » Improvements in the time it takes to get relevant information to the business users and allowing them to act faster to changes
- » Optimization of our data replication processes
- » Enabling of SAP data self-service

## Project overview

### Company

Cementos Argos

### Area of business

Cement

### Department

IT department and Analytics Center (Finance department)

### System environment

- » SAP ERP
- » SAP BW/BO
- » Microsoft Azure
